

Bryant Homes Case Study

Bryant Homes is the first national House builder to adopt the Intamac Home Manager service as standard for all the properties on an entire housing estate.

The Intamac Home Manager service links Bryants' 51 digitally networked new-build homes in Isleworth, Middlesex to the Internet, allowing homeowners to monitor and control their security systems from anywhere in the world. Intamac's technology monitors sensors connected to the Scantronic alarm panels in each of the properties.

Peter Andrew, Regional Managing Director of Bryant Homes commented "By linking all the homes on the estate to Home Manager customers can benefit from new levels of service and wider protection". He continues, "Messages from one home can be instantly relayed to neighbours and professional security companies whilst protecting the properties when the homeowners are away on holiday".

This package provides what a BBC TV article dubbed an electronic 'neighbourhood watch for the residents'.

Following on from this, Bryant Homes have continued working with Intamac Systems on technology developments. Bryant Homes now offer the BT Home Monitor VP1000, which is powered by the Intamac monitoring and messaging platform, as the recommended Security solution to every new house purchaser in the UK, through their Bryant Design range. As quoted in their latest brochure:

"When it comes to keeping your home and family safe, there is no question about it – we all want the very best. We also want to ensure our (home) security system is easy to manage, as aesthetically pleasing as it is efficient and that it adds value to everyday life. All this is now possible for Bryant Homes' customers thanks to the award winning BT Home Monitor VP1000 system"
